

Currently the reliance on onsite wastewater systems represents a major impediment for business and development especially when the respect for natural resources is paramount. The focus of this amendment is to identify the priority for establishing economically viable and environmentally sound approaches to the establishment of wastewater systems in the community. The infrastructure improvements must be needed, affordable and merge with the environment – not harm it. Improved wastewater services should be more attractive and more permanent than the current mound systems that are the predominant wastewater treatment choice. Working together as a community to get this done will be necessary since costs to repair, replace and manage this very valuable and resource sensitive environment cannot be done individually in many areas. Therefore, a community plan for more than one area in the Township will help define common groupings that could work together and save time and costs equally. (Kabetogama Comprehensive Plan, July 2008)
